

The Global Economic Impacts of the COVID-19 Pandemic

Warwick McKibbin and Roshen Fernando

Data Repository Accompanying the Journal Article

This repository contains the following files:

01. The epidemiological assumptions for 2020 in the first scenario
02. The shocks to emulate the scenarios
03. The simulation results from the G-Cubed model
04. The data used to produce the Tables, Figures, and Annexures in the paper
05. The R script to replicate the graphs in the Figures and Annexures

Running the first two sections in the script is required to produce the figures. After running them, the script indicates which sections should be run to produce the respective figures and annexures.

Results for a broader range of economic variables are also available from the [Dashboard](#) accompanying this paper.

The hybrid DSGE-CGE model G-Cubed has been used to assess the scenarios in this study. The equations for a reduced form of the model are accessible from [G-Cubed Documentation](#). Further details of the model are accessible from the below references.

1. McKibbin, W. & Triggs, A. 2018. Modeling the G20. Canberra: Centre for Applied Macroeconomic Analysis.
2. McKibbin, W. & Wilcoxon, P. 2013. A global approach to energy and the environment: the G-cubed model. *Handbook of CGE Modelling*. North-Holland.
3. McKibbin, W. & Wilcoxon, P. 1999. The theoretical and empirical structure of the G-Cubed model. *Economic Modelling*, 16, 123-148.

The model is not publicly available due to the proprietary data (such as the GTAP 10/11 databases) and software involved. The proprietary software could be obtained from the [McKibbin Software Group](#). The shocks, however, could be used in any CGE or multi-sector DSGE model after aggregating for desired country and sector combinations.
